Portfolio Documentation

I did not utilize any CSS frameworks or other libraries to accomplish making my portfolio. All the images on the page were either taken by me, or they are cropped and resized screenshots from their respective locations. In terms of going above and beyond, I used three different viewport sizes to determine when the page should change its layout. The three sizes included windows larger than 1250px, windows between 850px and 1250px, and windows smaller than 850px. Coming up with a design for the page took me some time to think about, but after looking at other examples from our class I put some of the ideas together and made my own portfolio page using mainly flexbox. Also I feel like I took all the CRAP principles into consideration when creating the page, and did a pretty good job applying them. Overall, I'm happy with the way the page turned out!
